DESCRIPTION

XO3225 oscillators utilise AT-Cut crystals providing much improved, tight frequency stability as opposed to that stabiity provided by 32.768kHz oscillators using the more usual X-Cut (tuning fork) crystals. The tight control of frequency provided by these oscillators results in a typical variation of 52 seconds for one month of continuous operation as against 260 seconds over the same period for oscillators that use tuning fork crystals.Other benefits include low supply current consumption coupled with quick start-up times.
